

Important !

This repository contains an Arduino sketch for using the Seeed XIAO and a LoRa module as a sensor node to connect to TTN.

You will need to be familiar with using the TTN console for setting up devices for OTAA authentication and for your part of the World, if you are to use the board for TTN. You will also need experience of setting up Arduino sketches that use LMIC for connections to TTN.

Do not attempt to use the Board_for_XIAO_LoRa_V2 as a TTN node unless you are fully familiar with the setup of a device with the TTN console and also have experience with setting up the needed Arduino sketches with the appropriate TTN keys. A detailed list of setup instructions, and free support, is not practical for a board that costs £1.
